

GUITAR BRIDGE AND TAILPIECE

ABSTRACT

[0035] An improved guitar bridge and tailpiece is provided for use in facilitating the tuning and retuning procedure for a guitar. The new guitar bridge and tailpiece each include a setscrew hole at each end of their respective base pieces. The setscrew holes are formed from an outer vertical edge to a vertical hole or slot therein. Into each setscrew hole is placed a setscrew which, upon fastening into the setscrew hole, contacts adjustment posts or studs which are mounted to a body of the guitar. By tightening the setscrews against the adjustment posts or studs, the bridge or tailpiece is fixedly mounted to the body of the guitar. Because the bridge and tailpiece remain fixed to the guitar body, once tuned, the strings do not require extensive tuning adjustment each time the strings are replaced.
